

## Grimwood Product Improvement – Bolt-on Immersion Elements

Grimwood have introduced an improved design to their highly successful range of Bolt-on Immersion Elements.

The change provides a “dead stop” on the flange of the element to assist the installer by ensuring optimum gasket compression. In the previous design it was possible for gasket leaks to occur when the gasket was over tightened or unevenly compressed.

The new design has a spigot moulded into the element flange so that the gasket compression is controlled and evenly achieved. This allows the installer to ensure he can easily achieve a leak proof joint that has been demonstrated to meet all the pressure tests required by Australian Standards for water heaters.

The highly successful Grimwood design of bolt-on immersion elements has been the template adopted by a number of Chinese copies currently available in the Australian market. Grimwood has moved to protect its intellectual property by registered the design of this improvement with IP Australia to prevent copying and imitation by others.

Beware of cheap copies of the genuine Grimwood Bolt-on Immersion Element!

Only product bearing the *Grimwood* brand and the *Australian Made* logo are true Grimwood products.
